1. INTRODUCTION

This appendix provides the results of the economic analysis of existing conditions flood damages, and flood risk reduction benefits for Cheltenham Township, Pennsylvania. The analysis described within this document was conducted as an element of the Tookany Creek Flood Risk Reduction Study. The economic analysis described in this appendix is consistent with Federal water resources policies and practice, including *Risk-Based Analysis for Flood Damage Reduction Studies* (EM 1110-2-1619), and the Corps *Planning Guidance Notebook* (ER-1105-2-100).

The purpose of this appendix is to evaluate plan alternatives against economic constraints for U.S. Army Corps of Engineers (Corps) participation in a flood damage reduction project. The economic constraints are:

- The need for flood damage reduction features to be efficient (*i.e.*, average annual NED benefits exceed average annual costs); and
- The requirement to select the flood damage reduction plan that maximizes net excess NED benefits (*i.e.*, the NED plan).

Contributions to NED include increases in the net value of the national output of goods and services expressed in monetary units. Direct benefits (e.g., prevented damages, reduction of emergency services costs) that accrue in the planning area from implementation of a flood risk reduction project are contributions to NED. A positive difference of project benefits minus project costs becomes a net contribution to NED. Similarly, if the result of project benefits divided by project costs exceeds 1.0. The project is said to have a positive benefit-to-cost ratio (BCR).

The Federal objective of water resources development is to identify a plan that maximizes net contributions to NED consistent with protecting the nation's environment, pursuant to national environmental statutes, applicable executive orders, and other Federal planning requirements. This plan is referred to as the NED plan, and becomes the basis for Federal cost-sharing in any project for flood damage reduction.

1.1 Water Resources Problem

The Cheltenham flood plain is subject to significant flooding from both Tookany and Rock Creeks, amongst other things. Based on the hydrologic and hydraulic analyses, floods that cause widespread damage are likely to result from the occurrence of various events ranging from an annual probability of 0.500 to 0.002 (depending on the location within the flood plain). Cheltenham has experienced major flooding periodically throughout the city's history.

1.2 Opportunity Identification

Flood risk reduction opportunities include the potential to reduce property damage, injuries and deaths. Due to certain study limitations, non-physical losses including emergency and income losses were not evaluated.

1.3 Methodology Overview

Flood damages are expressed in terms of expected annual damages, which defined as the monetary value of physical damages and non-physical losses that can occur in any given year based on the magnitude and probability of losses from all possible events. The basis for determining existing damages is an examination of losses sustained in historical floods, supplemented by appraisals, application of depth-damages curves, and an inventory of capital investment within the floodplain.

1.3.1 Major Damage Categories

Flood damages throughout the study area are classified as either physical or non-physical damages. Physical damages evaluated in this analysis account for a substantial proportion of flood damages, and include:

- Structural damages to buildings;
- Loss of contents of the buildings;

Potential additional Non-Physical damages were not included in the study results at the current study phase.

1.3.2 Selected Planning Reaches

The study area is located along Tookany and Rock Creeks through the city of Cheltenham and adjacent townships. Twelve separate reaches were delineated for Tookany Creek and one reach was delineated for Rock Creek. All reaches were analyzed using both left and right bank orientation along the creeks. The defined reaches are shown on Table 1.

Table 1: Study Area Reaches

Risk Sub Area	Reach Station		Reach Description	Index Section No.
TC-1	452.5	6255.87	Country club and Church	4730.68
TC-2	6255.87	9344.9	Cheltenham SEPTA Station	8871.58
TC-3	9344.9	13835	Cheltenham & Tennis Courts	12075.9
TC-4	13835	173952.1	Cheltenham High School	15556.5
TC-5	17392.1	19712.4	Harrison Ave Baseball Fields	18967.19
TC-6	19712.4	22682.5	Ogontz Field	21415.6
TC-7	22682.5	24098.1	Elkins Park Free Library	23274.8
TC-8	24098.1	29207.5	Wall Park & Beth Sholom Congregation	26368.19
TC-9	29207.5	31188.6	Glenside US Post Office	30700.3
TC-10	31188.6	35332.8	Wyncote & Parts of Abington Township	34003.5
TC-11	35332.8	37606.5	Harry Renninger Park	36540.6
TC-12	37606.5	40475.19	Easton Rd	39343.69
RC-1	17.85	3161.65	Chelten Hills	1525.29

As indicated on the table above, a single index location was selected within each reach. The index location was selected as a representative location within the reach based on hydrologic and hydraulic parameters. The index location is used to relate input data from each specific water surface profile for the categorical computation of stage, discharge, and damage within each subarea.

1.3.3 Land Use Database

Due to the large, urban residential make-up of the Cheltenham area, approximately 98% built-up, most land is zoned residential. As reflected in the economic structural inventory, few properties were zoned commercial, public, and industrial.

1.3.4 Period of Analysis

The starting period of analysis was set as current (2015), and the economic database for existing conditions is also used to characterize the base conditions. For purposes of this analysis, it is assumed that the existing level of development will remain the same for the period of analysis under future without-project conditions.

1.3.5 Risk and Uncertainty Analysis

The Hydrologic Engineering Center Flood Damage Analysis Version 1.2.5a risk analysis model, October 2010 (HEC-FDA) was used to compute expected annual damages for existing conditions and for all future with-project alternatives. Uncertainty parameters used in the HEC-FDA model for this analysis include:

- First floor elevations
- Structure values
- Content to structure ratios
- Percent depth-damage functions; and
- Stage-discharge functions

1.4 Other System of Accounts

The following table was used to examine the other system of accounts. They include the account for Other Social Effects (OSE), the account for Regional Economic Development (RED), and the system for Environmental Quality (EQ). It was deemed that the NED account would be most applicable system for analysis due to the minor impact of the other three. Table 2, shows the results of the analysis of the OSE, RED, and EQ:

Table 2: Analysis of OSE, RED, & EQ System of Accounts

Other Social Effects (OSE)		
Resource Categories	No Action Plan	Alternative 4 (Tentatively Selected Plan)
Aesthetics	No Impact	Temporary adverse impacts on sight and smell due to construction activities (equipment, earth moving) would disappear upon end of construction period.
Displacement effects	No Impact	No permanent displacement of people, businesses, or farms.
Educational, cultural, and recreational opportunities	No impact	Permanent increase in availability of transportation routes during and after severe storm events. Increased level of protection prevents disruption of community services such as schools, hospitals, and utilities.
Emergency Preparedness	No Impact	Permanent increase in access to flexible reserves of water supplies, critical power supplies, scarce fuels, evacuation routes and emergency transport to health facilities during and after storm events.
Long-term productivity	No Impact	Negligible impact on long-term productivity of resources.
Security of life, health, and safety	No Impact	Significant mitigation of related health risks, such as loss-of-life, trauma, hypothermia, water & air pollution, water-borne diseases, vector-borne diseases (through ephemeral water-bodies), and food & water supply disruption.

Social Vulnerability	No Impact	Permanent reduction in flood hazard exposure for highly vulnerable populations identified in the Social Vulnerability Index, including senior citizens, minorities, and persons living in poverty.
----------------------	-----------	--

* Social Vulnerability Index (SVI) is developed by the Agency for Toxic Substances and Disease Registry (ATSDR), a federal public health agency of the U.S. Department of Health and Human Services

Regional Economic Development (RED)		
Resource Categories	No Action Plan	Alternative 4 (Tentatively Selected Plan)
Employment distribution	No Impact	Temporary increase in construction-related jobs during construction. Permanent indirect positive impacts on employment opportunities for protected businesses, including opportunities for minority workers.
Fiscal condition of State and Local sponsor	No Impact	Permanent reduction in clean-up, emergency response, resource allocation, and other flood-related costs. Permanent increase in tax base of workers and businesses.
Population distribution and composition	No Impact	Minimal temporary impact on population distribution or composition.
Real income	Loss of business income and wages as businesses close during and/or after storm events	Permanent increase in real income for below-poverty and near-poverty workers from temporary construction work and permanent wage opportunities from open businesses.

Environmental Quality (EQ)		
Resource Categories	No Action Plan	Alternative 4 (Tentatively Selected Plan)
Water Resources	No Impact	There will be minor impacts to wetlands as a result of this proposed project. Approximately 0.25 acres of wetlands will be impacted by construction of the proposed West Waverly basin. Mitigation in the form of wetland restoration of approximately 1.0 acre of the West Waverly property will be completed to compensate for this loss. In addition, the project will comply with Title 25 Pa. Code Chapter 102, Erosion and Sediment Control and Stormwater Management.

Air Quality	No Impact	The total estimated emissions that would result from construction of the Tookany Creek Flood Damage Reduction Project is 3.89 tons of NOx, 1.67 tons of VOC, and 0.34 tons of PM 2.5. These emissions are well below the General Conformity trigger levels of 100 tons of NOx and PM2.5; and 50 tons of VOC per year. General Conformity under the Clean Air Act, Section 176 has been evaluated for the project according to the requirements of 40 CFR 93, Subpart B. The requirements of this rule are not applicable to this project because the total direct and indirect emissions from the project are below the conformity threshold values established at 40 CFR 93.153 (b) for ozone (NOx and VOC) in a Moderate Nonattainment Area. The project is not considered regionally significant under 40 CFR 93.153 (i).
Biological Resources	No Impact	A Pennsylvania Natural Diversity Inventory (PNDI) search run on the Pennsylvania Natural Heritage Program website indicated that no Federally-listed species are found in the project area and, hence no impacts to Federally listed or proposed species would be anticipated from the proposed project. No long-term impacts to the fish and wildlife resources in the Tookany Creek watershed are anticipated as a result of this project. There will be noise and general disturbances in the stream area as a result of construction activities, but these will be temporary in nature and should not have a long term negative effect on wildlife in the area.
Cultural Resources	No Impact	Based on the results of the Phase IA investigation, additional subsurface archaeological investigations may be required at 8 of the 9 proposed dry detention basins for Alternative 4 to properly assess their potential to contain undocumented prehistoric or historic archaeological sites. The USACE, in consultation with the Pennsylvania State Historic Preservation Officer (SHPO), the Tribes, and other consulting parties will review the results of all investigations and determine any effects to historic properties eligible for or listed on the NRHP, and work to avoid, minimize, or mitigate those effects. In addition, further architectural assessments may be required in order to assess the proposed

		impacts that Alternative 4 may have on above ground historic properties.
Land Use	No Impact	There will permanent change in the nature of the stream and land use in the proposed basin areas. For the areas proposed for detention basins, some of the basins will go from private property to public property. In addition, the land use will change from its existing use to detention basins which will hold water during storms. If the funding is available, rain gardens will be planted in the basin areas using native plants to enhance the area for wildlife resources. If this happens, the project will provide a long-term positive impact to the wildlife in the Tookany Creek watershed. Rain gardens would also make for an enhanced public space for passive recreation (i.e., walking).
HTRW	No Impact	Based on the best available information at this time in the Planning process, it does not appear that there are any HTRW concerns for the project; however, additional investigations on this issue will occur during the D&I phase of the project.
Noise	No Impact	There will be noise and general disturbances in the project area as a result of construction activities, but these will be temporary in nature and should not have a long term negative effect on the noise level of the neighborhoods.

2. SOCIAL AND ECONOMIC SETTING

The Township of Cheltenham borders North Philadelphia, Pennsylvania. According to the U.S. Census Bureau, Cheltenham Township covers 9 square miles, which is approximately 1.8% of the land area in Montgomery County. There are approximately 4,088 persons per square mile in Cheltenham, which is roughly 247% more urban than the average for the remainder of the county. Below, Table 2 provides a more relevant breakdown.

Table 3: Land Area and Population Density

	Cheltenham Township	Montgomery County	Pennsylvania	United States
Land area in square miles, 2010	9	483	44,817	3,531,905
Person per square mile, 2010	4,088	1656	283	87

Source: U.S. Census Bureau

2.1 Population & Demographics

In 2010, there were approximately 36,800 persons living in Cheltenham Township, representing 4.6% of the population of Montgomery County. The township population has remained relatively constant from 2000-2010 at approximately -0.2% change, falling behind Montgomery County at 6.8%, Pennsylvania at 3.4%, and the United States at 9.7%. Table 3 below shows the historic population growth across Cheltenham Township, Montgomery County, the state of Pennsylvania, and the United States.

Table 4: Historic Population Growth (2000-2010)

Category	Cheltenham Township	Montgomery County	Pennsylvania	United States
Population, 2010	36,793	799,874	12,702,379	308,745,538
Population (% change)	-0.2%	6.8%	3.4%	9.7%

Source: U.S. Census Bureau

Population projections for Cheltenham Township at 0.52% growth over the next ten years lag behind the statewide average at 1.33% and significantly lag behind the county projected growth rate at 3.04%. This pattern continues into the projection for year 2030. Table 4 shows the Projected Population Growth until 2030 in Cheltenham Township, Montgomery County, and Pennsylvania.

Table 5: Projected Population Growth (2010–2030)

Location	2010 Actual	2020 Projected	2030 Projected	2010-2020 Projected	2020-2030 Projected
Cheltenham Township	36,793	36,985	37,653	0.52%	1.81%
Montgomery County	799,874	824,165	875,214	3.04%	6.19%
Pennsylvania	12,702,379	12,871,823	13,190,400	1.33%	2.48%

Source: U.S. Census Bureau

Current population in Cheltenham Township is 56% Caucasian, with 32% African American, 8% Asian, and 5% Hispanic populations representing the rest of the township. Cheltenham is significantly more diverse in terms of Caucasian population than Montgomery County with 81.5%, Pennsylvania with 83.2%, and the United States with 77.7%. Table 5 shows the population demographics, separated by Race, of Cheltenham Township, Montgomery County, Pennsylvania, and the United States.

Table 6: Population Demographics (2013)

Category	Cheltenham Township	Montgomery County	Pennsylvania	United States
White persons	56.0%	81.5%	83.2%	77.7%
Black persons	31.9%	9.3%	11.5%	13.2%
American Indian	0.0%	0.2%	0.3%	1.2%
Asian persons	8.1%	7.1%	3.1%	5.3%
Hispanic persons	4.7%	4.7%	6.3%	17.1%
White persons not Hispanic	52.8%	77.7%	78.4%	62.6%

Source: U.S. Census Bureau

The level of High School educational attainment in Cheltenham Township at 95.3% is on par with Montgomery County at 93.5% and higher than the 88.7% rate in the rest of the state and the national average of 86.0%. Attainment of a Bachelor's Degree or Higher shows a similar trend with Cheltenham Township showing 53.5% attainment, Montgomery County close at 45.5% and significantly ahead of Pennsylvania at 27.5% and the United States at 28.8%. Table 6 shows the educational attainment of High School and College Degrees in Cheltenham, Montgomery County, Pennsylvania, and the United States.

Table 7: Educational Attainment (2009–2013)

Category	Cheltenham Township	Montgomery County	Pennsylvania	United States
High School Grads, persons age 25+	95.3%	93.5%	88.7%	86.0%
Bachelor's Deg or Higher, persons age 25+	53.5%	45.5%	27.5%	28.8%

Source: U.S. Census Bureau

Home ownership rate in Cheltenham Township is at 62.9%, lower than Montgomery County, 73.2%, and Pennsylvania, 69.8%, but mostly in line with the average US home ownership rate at 64.9%. Using rounded figures, Cheltenham Median Household Income is at \$76,300, similar to Montgomery County figures, \$80,000, but significantly higher than Pennsylvania at \$52,500, and the United States at \$53,000. Table 7 uses 2013 dollars and shows Homeownership Rate, Median Household Income, Per Capita Income, and Poverty level for Cheltenham, Montgomery, Pennsylvania, and the United States.

Table 8: Income and Home Ownership (2009–2013)

Category	Cheltenham Township	Montgomery County	Pennsylvania	United States
Homeownership rate	62.9%	73.2%	69.8%	64.9%
Median household income (2013 dollars)	\$76,280	\$79,183	\$52,548	\$53,046
Per capita income in past 12 months (2013 dollars)	\$39,879	\$41,472	\$28,502	\$28,155
Persons below poverty level	8.4%	6.1%	13.3%	15.4%

Source: U.S. Census Bureau

The percent of current Cheltenham population, 37%, that is traditionally considered to be non-earners (less than 18 years or over 65 years of age) is consistent with the remainder of the county at a 38.3% county average, with the state of Pennsylvania at 37.7%, and with the United States at 37.4%. Table 8 shows Persons under 18 years old, Persons over 65 years old, and the combined percentages to show Non - Potential Earners in the general population for Cheltenham, Montgomery, Pennsylvania, and the United States.

Table 9: Non-Potential Earners in Population (2010)

Category	Cheltenham Township	Montgomery County	Pennsylvania	United States
Persons under 18 years, percent	20.6%	22.2%	21.3%	23.3%
Persons 65 years and over, percent	16.4%	16.1%	16.4%	14.1%
Combined	37.0%	38.3%	37.7%	37.4%

Source: U.S. Census Bureau

2.2 Labor & Employment

The Labor Force in Cheltenham Township, -0.45%, fell at a rate comparable to the state of Pennsylvania, -0.82%, but less harshly than the Labor Force for Montgomery County, -1.25%. The Labor Force for the United States slightly increased over the same time span at 0.18%. Table 9 below shows the labor force for each year between Dec 2008 and Dec 2013, and the aggregate growth rate over that time span, for Cheltenham, Montgomery, Pennsylvania, and the United States. Note: Labor Force for Cheltenham township was estimated using total population, employment statistics, and unemployment rate.

Table 10: Labor Force (2008–2013) (in hundreds)

Location	Dec 2008	Dec 2009	Dec 2010	Dec 2011	Dec 2012	Dec 2013	Growth 2008 - 2013
Cheltenham Township	221	219	220	221	223	220	-0.45%
Montgomery County	4394	4194	4305	4312	4385	4339	-1.25%
Pennsylvania	64,773	63,648	63,979	64,206	64,943	64,239	-0.82%
United States	1,546,550	1,531,110	1,536,390	1,539,270	1,554,850	1,549,370	0.18%

Source: U.S. Census Bureau

Unemployment in Cheltenham Township has generally followed the rest of the country, increasing to 6.9% until slowly reverting back to approximately pre-recession levels of 5.0%. Cheltenham's unemployment rate is similar to the rest of the county at 5.1%, and lower than Pennsylvania at 6.2% and the national average at 6.5%. Table 10 shows the unemployment rate at December of Years 2008 through 2013 for Cheltenham, Montgomery County, Pennsylvania, and the United States.

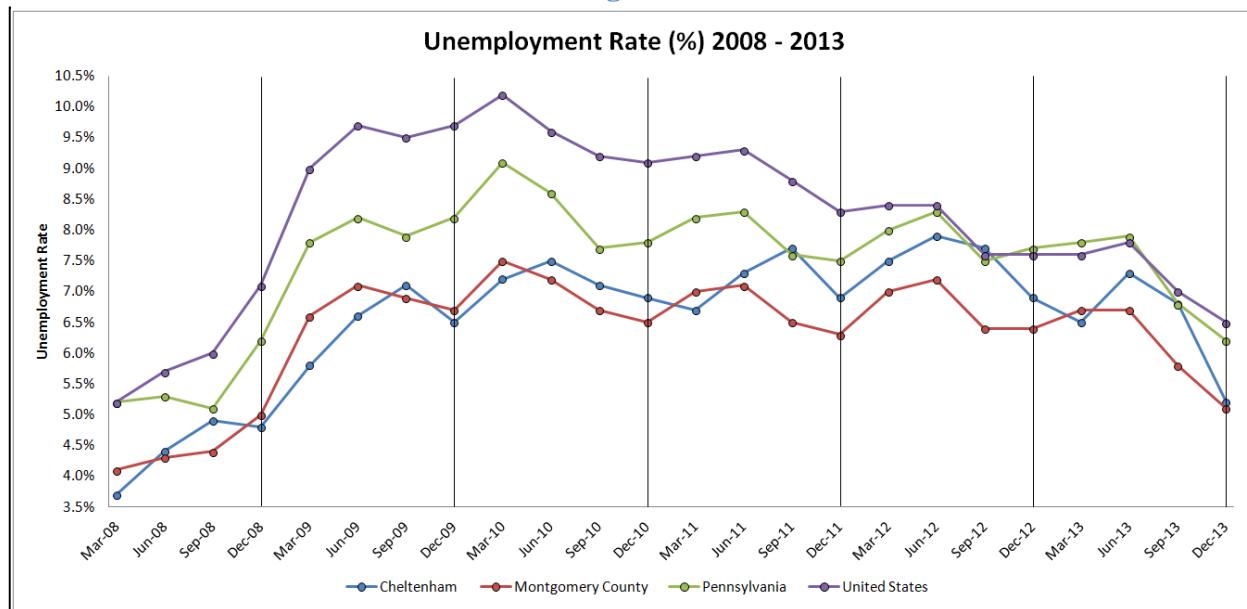

Table 11: Unemployment Rate (2008–2013)

Location	Dec 2008	Dec 2009	Dec 2010	Dec 2011	Dec 2012	Dec 2013
Cheltenham Township	4.8%	6.5%	6.9%	6.9%	6.9%	5.2%
Montgomery County	5.0%	6.7%	6.5%	6.3%	6.4%	5.1%
Pennsylvania	6.2%	8.2%	7.8%	7.5%	7.7%	6.2%
United States	7.1%	9.7%	9.1%	8.3%	7.6%	6.5%

Source: U.S. Census Bureau

Figure 1 below shows the continuous unemployment rate from Cheltenham, Montgomery County, the state of Pennsylvania, and the United States over the six year span from 2008 to 2013.

Figure 1

U.S. Bureau of Labor Statistics

The top five employment industries in Cheltenham are Professional, Scientific & Technical Services, Health Care & Social Assistance, Retail Trade, Construction, and Other Services (except Public Administration). These five industries employ over 85% of the labor force in Cheltenham, compared to 47% for Pennsylvania, and 45% for the United States. Table 11 shows the Employment by Industry, as identified by their NAICS codes, Cheltenham, Pennsylvania, and the United States. The categories are ordered by highest-to-lowest percentage employment by industry in Cheltenham Township.

Table 12: Employment by Industry (2010)

Industry (by NAICS Code)	Cheltenham Township		Pennsylvania		United States	
Professional, Scientific & Technical Services	724	40.29%	330,674	6.39%	8,143,050	6.84%
Health Care & Social Assistance	394	21.93%	885,937	17.12%	16,833,731	14.14%
Retail Trade	220	12.24%	674,803	13.04%	15,702,752	13.19%
Construction	111	6.18%	264,953	5.12%	7,440,652	6.25%
Other Services (Except Public Administration)	95	5.29%	249,429	4.82%	5,547,750	4.66%
Finance & Insurance	83	4.62%	288,758	5.58%	6,678,729	5.61%
Arts, Entertainment & Recreation	47	2.62%	80,210	1.55%	2,083,383	1.75%
Wholesale Trade	41	2.28%	237,526	4.59%	5,976,332	5.02%

3. STRUCTURE INVENTORY DEVELOPMENT

Development of the structure inventory involved surveying existing floodplain structures to collect the data necessary to determine expected flood damages. The purpose for collecting this information is to determine what structures are located in the floodplain; the depreciated replacement value of the structures and their associated contents; and the zero-damage elevation at which they are initially

susceptible to flooding. This information is then used in the computation of existing and future conditions flood damages.

Structure inventory development began by establishing the geographic limits of the study area as defined by the study area reaches shown in Geographic Information System (GIS) shape-files. The reach shape-files are shown projected on aerial photography in Figures 1, and correspond to the reaches listed in Table 1 shown previously. Section 7 of this appendix shows all of the study area damage reaches.

Development of the structure inventory included the seven steps listed below

Step 1: Develop structure-based GIS data for the Cheltenham area, and select structures that fall within the study area reaches.

Step 2: Acquire structure characteristics and valuation data for the Cheltenham area.

Step 3: Assign structure types / occupancy classification codes.

Step 4: Derive structure ground elevations, and assign cross sections.

Step 5: Calculate structure depreciated replacement values.

3.1 Acquire Tax Assessor's Data & Select study Area Parcels

Structure Geometry was created by photographic tracing through GIS. Descriptive parcel information was obtained through the Cheltenham Tax Office. Structure geometry was overlaid onto the Cheltenham study area reach maps, along with the 500-year floodplain parameters, using ARC-GIS, and those parcels within or near the 500-year flood plain were selected for further analysis. Figure 3 shows an example of structures selected within Reach TC-9. In the figure, the limits of reach TC-9 are designated by a solid yellow line, and the structures selected for further analysis are the many rectangular dark pink shapes. The Tookany Creek 500-year flood-plain is designated by a solid bright turquoise line while the Rock Creek 500-year flood-plain is designated by a solid bright green line. Tookany Creek is designated by a deep red solid line. The final dataset for all study area reaches included 204 structures for further analysis.

The data obtained from the Cheltenham tax office was based on the following categories:

Street Address	City	State	Zip Code	Number of Stories
Year Built	Number of Units	Wall Material	Square Feet	Basement
Garage	Block			

3.2 Structure Characteristics and Valuation Data

Tax assessment data that describe structure characteristics and valuation were collected from The Cheltenham Township and through professional opinion of a local realty. Structure values in the residential damage categories of R1S and RMS, as shown below in Table 13, were developed with the aid of a local realty company. Residential structures per neighborhood within the 500-year floodplain were identified. The land value was subtracted from each structure based on the amount accounted for from the tax data. Their structure improvement valuations were expressed as a minimum, most likely, and maximum values. Triangle distributions were fitted per structure to describe the error in opinion. The median value was then assigned per structure.

Commercial, industrial and public structure valuations were solely based on the tax assessed improvement value per structure.

3.3 Structure Occupancy Classification Codes

Structure occupancy classification codes were assigned through an examination and analysis of all available data obtained from the township and professional opinion. 37 of the 241 studied structures were deemed to be outside of the floodplain. Remaining structures were assigned to one of seven categories:

- Residential – Multiple Story House
- Residential – Single Story House
- Commercial – Multiple Story Building
- Commercial – Single Story Building
- Industrial – Single Story Building
- Public – Multiple Story Building
- Public – Single Story Building

Table 12 below shows the classification of occupancy types and their unique associated HEC-FDA model identifier.

Table 13: HEC-FDA Structure Occupancy Types

	Residential	Commercial	Industrial	Public
Single Story	R1S	C1S	I1S	P1S
Multiple Story	RMS	CMS		PMS

Depth-Percent Damage functions were then defined for each of the occupancy types relative to the totality of which a structure and its associated contents will be damaged. To capture any uncertainty in calculation outputs a stochastic distribution was chosen and defined with a generalized standard deviation at each inundated foot interval in accordance with Economic Guidance Memorandum (EGM) 04-01 and EGM 01-03. The most frequent structure occupancy type Depth-Percent Damage relationship is RMS shown below in Table 13. All the occupancy type depth-percent damage relationships are reported in section 8 entitled Structure Occupancy Type Depth-Percent Damage Functions.

Table 14: RMS Occupancy Type Depth-Percent Damage Functions

Structure			Content		
Depth (ft.)	Damage (Percent)	Standard Deviation of Error	Depth (ft.)	Damage (Percent)	Standard Deviation of Error
-8.00	0.0	0.000	-8.00	0.0	0.000
-7.00	1.7	1.400	-7.00	1.0	1.200
-6.00	1.7	1.410	-6.00	2.3	1.230
-5.00	1.9	1.420	-5.00	3.7	1.250
-4.00	2.9	1.430	-4.00	5.2	1.270
-3.00	4.7	1.440	-3.00	6.8	1.280
-2.00	7.2	1.450	-2.00	8.4	1.290
-1.00	10.2	1.460	-1.00	10.1	1.300
0.00	13.9	1.470	0.00	11.9	1.330
1.00	22.3	1.480	1.00	13.8	1.350
2.00	27.0	1.490	2.00	15.7	1.390
3.00	31.9	1.500	3.00	17.7	1.430
4.00	36.9	1.750	4.00	19.8	1.670
5.00	41.9	2.040	5.00	22.0	1.920
6.00	46.9	2.340	6.00	24.3	2.150
7.00	51.8	2.630	7.00	26.7	2.360
8.00	56.4	2.890	8.00	29.1	2.560
9.00	60.2	3.730	9.00	31.7	2.760
10.00	64.2	3.380	10.00	34.4	3.040
11.00	68.4	3.710	11.00	37.2	3.460
12.00	71.4	4.000	12.00	40.0	4.120
13.00	73.7	4.000	13.00	43.0	5.000
14.00	75.4	4.000	14.00	46.1	6.000
15.00	76.4	4.000	15.00	49.3	7.000
16.00	76.4	4.000	16.00	52.6	8.000

The content-to-structure value ratio used for assigning value to contents of occupancy types is defined in the study as a stochastic probability distribution. For purposes of this study, generic inputs were used in accordance with EM 1110-2-1619. The stochastic parameters were defined as follows:

$$\mu = 0.435$$

$$\sigma = 0.253$$

The tails of the distribution were limited with a minimum of 0.100 and a maximum of 2.500. Each ratio generated by the distribution model is assigned to a structure in the economic inventory. It becomes the generic percent of content damage each structure is expected to experience. Note that the input ratio

mean (μ) and standard deviation (σ), above, are less than ratios commonly used by casualty insurance companies, but those reflect replacement costs rather than depreciated replacement costs.

Further uncertainty parameters were defined for the error associated with the first floor stage standard deviation set at 1.5 feet in accordance with EM 1110-2-1619; due to the approximate measurements of structures through the use of aerial/satellite photography. The first floor stage is the difference in elevation between the ground and the standing first floor of a structure. All residential structures were assumed to have basements and allocated beginning depth-percent damage depth at -8ft. below each structure's assigned first floor elevation. This applies to both structure and contents damage categories in accordance with the methodology described for aggregating damage relationships per USACE district in IWR Report 92-R-3. The other factors required to define uncertainty parameters were structure value error per occupancy type and the associated structure-to-content value ratio error. Each of these parameters was set to the HEC-FDA model default of 5.00% standard deviation. All three error parameters were chosen to be represented by stochastic probability distributions.

3.4 Stage-Damage Functions

USACE defines a stage-damage function as the relationship of direct economic costs caused by flood inundation to a range of flood stages for a given river or damage reach. Through the aggregation of the depth-percent damage functions, first-floor stage elevations, and structure, content, and other category values with the hydrologic engineering relationships the model calculates the stage-damage functions. The information is used to calculate the relationship by damage category at each damage reach index location station. The HEC-FDA model requires a complete set of stage-damage functions for all categories, damage reaches and streams developed to analyze a specific plan for an analysis year. The uncertainty was defined by a stochastic probability density function. All tabular data and graphical displays of the study stage-damage functions for the existing conditions and tentatively selected plan can be found in sections 9 & 10 of this appendix.

3.5 Hypothesis Test of Structure Depreciated Replacement Value

The population mean of depreciated structure value for the structure inventory is statistically less than the mean generated from the R/S Means software. The test findings support the efforts to use a conservative methodology to estimate structure depreciated replacement value for the Tookany Creek Flood Risk Management Economic Analysis. The study depreciated structure values were calculated using tax assessment data from Cheltenham Township, PA and included the description of uncertainty calculated using data input from professional opinion as described in EM 1110-2-1619, chapter 6.

A stratified sample of 20 structures from the economic structure inventory developed for the TCFRM study. The depreciated structure values were calculated using two different methodologies. First, the study depreciated structure values were calculated using the previously referenced methodology. Second, the same sample was used to calculate the depreciated structure value using the R/S Means processing software. Descriptive statistics were taken of the results for the sample and the population of the TCFRM structure inventory depreciated structure values, as shown in Table 1. The intent was to understand the statistical difference, if any, in depreciated structure valuation methodologies. The R/S Means sample resulted in a mean depreciated structure value of \$188,270 with a standard deviation of \$31,820. The R/S Means sample mean is higher than the other structure inventory population mean of \$122,880.

Table 15:Descriptive Statistics For The Opposing Methodologies

R/S Means Depreciated Structure Value (in \$1,000's)	Depreciated Structure Value Using Tax Assessment Data and Professional Opinion (in \$1,000's)
Mean	188.27
Standard Error	7.12
Median	181.77
Mode	203.18
Standard Deviation	31.82
Sample Variance	1,012.70
Kurtosis	-1.07
Skewness	0.26
Range	111.13
Minimum	139.77
Maximum	250.90
Sum	3,765.40
Count	20.00
Confidence Level(95.0%)	14.89
Mean	122.88
Standard Error	2.87
Median	113.95
Mode	91.03
Standard Deviation	40.98
Sample Variance	1,679.64
Kurtosis	7.22
Skewness	1.97
Range	305.47
Minimum	60.57
Maximum	366.04
Sum	25,066.53
Count	204.00
Confidence Level(95.0%)	5.66

Based on these results, it was determined to understand if the R/S Means sample mean differs from the population mean of the structure inventory methodology employed for the study. A hypothesis test using the critical value approach was conducted. In particular, the competing hypotheses are:

$$H_0: \mu = \$122,880$$

$$H_A: \mu \neq \$122,880$$

The sample value of the test statistic is denoted as “Z.” The following equation was used to derive the test statistic because both the population mean (μ) and the population standard deviation (σ) are known:

$$Z = (\bar{x} - \mu_0) / (\sigma / \sqrt{n})$$

$$Z = (\$188,270 - \$122,880) / (\$40,980 / \sqrt{20})$$

$$Z = 4.47$$

For a two-tailed test, the significance level is split in half to determine the two critical values, one on each tail of the distribution for the test statistic. Given a 5% level of significance, $\alpha/2 = 0.05/2 = 0.025$ is used to derive:

$$Z_{\alpha/2} = Z_{0.025} \text{ as } 1.96$$

Thus, the critical values are -1.96 and 1.96. The decision rule is to reject the H_0 if $Z > 1.96$ and $Z < -1.96$, or alternatively, if $|Z| > 1.96$. Since $Z = 4.47$ does fall in the rejection region ($|4.47| > 1.96$),

the null hypothesis is rejected. At the 5% significance level, it is concluded that the population mean for depreciated replacement value of the structure inventory differs from the mean depreciated structure value calculated using the R/S Means software.

Also, for further specification, a two-tailed test using a 95% confidence interval, given the mean value of $\mu_0 = \$122,880$, was conducted. The decision rule is:

$$\text{Reject } H_0 \text{ if } \mu_0 < \bar{x} - Z_{\alpha/2} \frac{\sigma}{\sqrt{n}} \text{ or } \mu_0 > \bar{x} + Z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$$

Following the rule above and using the previous calculated sample statistics the resulting confidence interval is approximately [\$216,929, \$159,613]. Since the population mean $\mu_0 = \$122,880$ falls below the 95% confidence interval, we further reject the null hypothesis H_0 .

A second critical value approach hypothesis test is proposed to determine whether the population mean of \$122,880 is significantly smaller in a statistical manner than the sample mean of \$188,270. The competing hypothesis is constructed as:

$$H_0: \mu \leq \$188,270$$

$$H_A: \mu > \$188,270$$

Note that in the right-tailed test, the null hypothesis is rejected on the right tail of the normal distribution of the test statistic. The right-tailed critical value is $Z_\alpha = 1.645$ because the given level of significance is considered at 5%. The previous critical value approach formula was used to calculate the test statistic as $Z = -7.14$. Because $-7.14 < 1.645$ the null hypothesis is not rejected.

4. HYDROLOGIC ENGINEERING HEC-FDA MODEL INPUTS

Components for the Hydraulic and Hydrologic (H&H) requirements of the HEC-FDA model include: water surface profiles (WSP), exceedance probability functions, stage-discharge functions, and levee features. The WSPs are required when computing stage-damage uncertainty functions at damage reach locations. They also must be consistent with discharge-probability and stage-discharge functions required for each plan, analysis year, stream, and damage reach.

4.1 Water Surface Profiles

The WSPs were developed in HEC-RAS and imported into the HEC-FDA model as .wsp file extensions. Each file contains eight flood scenarios, all discharge based, with exceedance probability flood events at 0.5, 0.2, 0.1, 0.04, 0.02, 0.01, 0.004, and 0.002 frequencies. Rock Creek and Tookany Creek each have separate WSPs modeled for existing conditions and each alternative plan under consideration. The stream stationing contained in each file is consistent with each damage reach and structure location stationing in the structure inventory. Various updates and modifications were made to some WSP files by H&H throughout the study process. File names specify which WSPs were modified. A list of WSPs generated for the study is exhibited in Table 14, below.

4.2 Exceedance Probability Functions

An exceedance probability function is the relationship between flood magnitude and the probability of exceeding the magnitude. For this study, the relationship was defined through hydrologic analysis in terms of discharge of cubic feet per second (cfs). Functions are assigned to each plan, analysis year, stream, and damage reach. Uncertainty calculations in the functional relationship are aided through the equivalent record length data. For gauged areas, equivalent record length is the number of years of a systematic record of recorded peak discharges at the stream gauge. The ordered events method was used to determine standard errors of points (estimates) along the curve from the relationship of each of the estimates to adjacent points and the slope of the function. Ordered events are interpolated from the function based on the equivalent record length and error limit curves determined using order statistics. The final exceedance probability function is based on the mean or expected values defined by Weibull plotting positions along the curve. The flood magnitudes considered for the functions are the exceedance probability flood events derived from each unique WSP and listed below in Table 15. All tabular data and graphical displays of the study exceedance probability functions for the existing conditions and tentatively selected plan can be found in sections 9& 10 of this appendix.

Table 17: Flood Magnitudes & Equivalent Record Length Input

	0.500
	0.200
	0.100
	0.040
	0.020
	0.010
	0.004
	0.002
Equivalent Record Length (N) = 27	

4.3 Stage-Discharge Functions

The stage-discharge function is used to transform the discharge into stage for each probability. It is the relationship between discharge (flow) at a river cross-section and the stage (depth) produced by that discharge. The relationship for the study was defined through gauge analysis. Functions are assigned to each plan, analysis year, stream, and damage reach. All tabular data and graphical displays of the study stage-discharge functions for the existing conditions and tentatively selected plan can be found in sections 9 & 10 of this appendix.

5. EXISTING CONDITIONS EXPECTED ANNUAL DAMAGES

Expected annual damages are based on fiscal year 2015 price levels, a FY16 discount rate of 3.125%, and a 50-year project life. Expected annual flood damages (EAD) under existing without project conditions are approximately \$2,092,000. The EAD summary is presented by reach on Table 18. Easton Rd. has over 51% of the total commercial damages, while TC-10 makes up all the industrial damages. TC-3 comprises over 82% of the total public damages. The majority of residential damages, at just over 37%, can be found in reach TC-7, all near the Elkins Park area. This reach also has the highest total damage amount on Tookany Creek at over 32% of total EAD. Reach RC-1 was modeled for Rock Creek in the Chelten Hills area. While it represents no commercial, industrial or public damages, it makes up over 10% of the total residential damages, and over 9% of total EAD.

EAD is calculated by summing all damage category damage-frequency relationships and then taking the mathematical integral of the total damage-frequency curve between the analysis year 2015 and 2065. All tabular data and graphical displays of the study damage-frequency functions for the existing conditions can be found in section 9 of this appendix.

Table 18: Existing Conditions Expected Annual Damages by Damage Categories and Damage Reaches (Damage in \$1,000's)

Damage Reach Name	Damage Reach Description	Damage categories				Total
		Commercial	Industrial	Public	Residential	
TC-1	Country Club	0.00	0.00	0.00	0.00	0.00

RC-1	Chelten Hills	0.00	0.00	0.00	190.65	190.65

6. EVALUATION OF PRELIMINARY ALTERNATIVES

U.S. Army Corps of Engineers (USACE) procedures calculate benefits based on the difference between the expected annual damages with and without alternative flood damage reduction plans. The implicit assumption incorporated into this procedure is that the reduction in flood damages is directly translatable into increased net income to floodplain land uses. Benefits from flood damage reduction alternatives focus on inundation reduction benefits that would result from reduced physical damages to structures and contents. Due to certain limitations, reduced non-physical losses were not assessed for this study.

Nine alternative detention basin configurations were considered in the evaluation of alternatives:

1. D1 – 5 detention basins on the Upper Tookany
2. D9 – 3 detention basins on Baederwood Creek
3. D12 – 1 storage area on Baederwood Creek at West Highland Ave
4. D15 – 1 detention basin at Washington Land on Rock Creek
5. D16 – 3 detention basins on Rock Creek
6. D25 – The combined plans of D1, D9, & D16
7. D27 – 5 detention basins on the Upper Tookany, 3 on Baederwood, and 1 on Rock Creek
8. D28 – 3 detention basins on the Upper Tookany
9. D30 – The combined plans of D28, D12, & D15

6.1 Benefits of Alternative Plans

With-project average annual flood damages (i.e., residual damages) for each of the nine alternatives are shown in Table 17. Expected annual damages under without-project conditions equal \$2,092,000. As shown in Table 17, average annual residual damages range from \$1,008,000 (D27) to \$2,147,000 (D28). It is important to note that average annual residual damages are average annual damages that remain after a project has been constructed. Average annual benefits of the alternatives - which are equal to the difference between residual damages under each alternative and damages under without-project conditions - are shown in Table 17, and range from \$43,000 (D28) to \$1084,000 (D27).

Table 19: Evaluation of Alternative Basin Plans (FY 2013 Prices in \$1,000's Except BCRs)

6.2 Costs of Alternative Plans

Preliminary cost estimates used to screen alternative plans were prepared using 2015 price levels, and are based on calculated quantities and unit prices for preliminary designs. The data was then indexed to 2013 price levels using EM 1110-2-1304. It is assumed that the construction area will be in vacant possession and has non-restrictive access. The productivity rates are based on normal job site conditions. The estimate does not include overtime wages and is based on a forty hour week during normal working hours. The phasing of work is not included. It is assumed that there will not be excessive general/supplemental conditions requirements and additional restrictive specifications during the bid process. RS Means, MII electronic cost book, and vendor price quotes were utilized in data processing. Labor rates are based on General Decision Number: PA140006 PA610. Financial First Costs of the alternative plans include construction costs, real estate acquisition costs, supervision & administration, engineering & design, and contingencies.

Interest during construction calculations are based on a 24-month construction schedule and a 3.375% discount rate. Interest incurred for real estate expenditures are accrued in the first month of construction, and carried through to the end of construction.

Average Annual Economic Costs were calculated based on the FY-15 Federal discount rate of 3.375% and an analysis period of 50 years. Operations and maintenance (O&M) costs are expected to be minimal, and a \$1,000 place holder is applied in the screening. Average Annual Costs of the alternatives shown above in Table 17 range from \$26,000 (D12) to \$383,000 (D25).

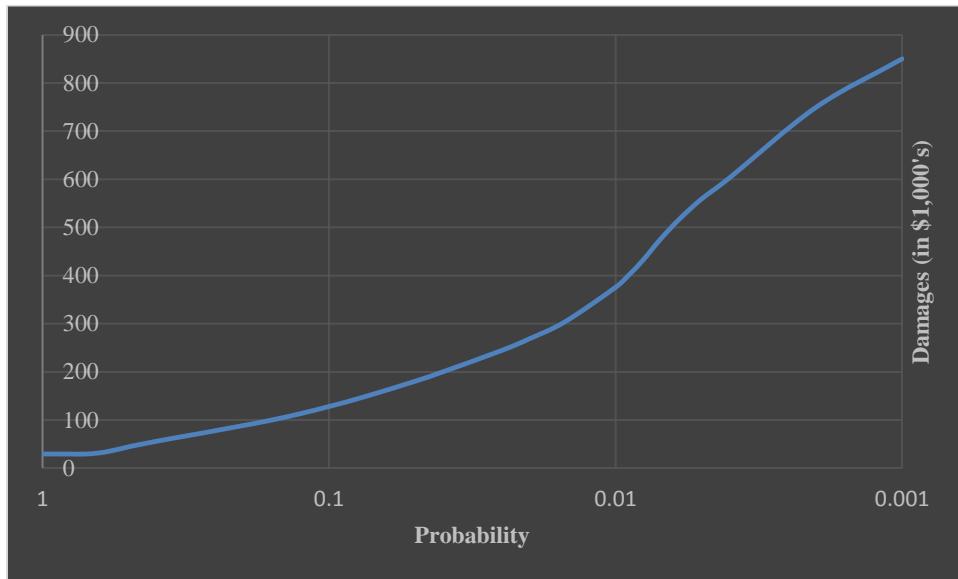

6.3 Floodplain Evacuation Consideration

The industrial structure at 1 North Avenue is owned by Mack Electric Devices, a certified service-disabled veteran owned small business. This structure was identified for a potential non-structural solution. Flood-plain evacuation analysis, commonly referred to as “buy-out” analysis, was conducted in accordance with CECW-PD, and dated 22 January, 2001. The purpose of which is to provide implementation guidance for the analysis. The structure is analyzed to understand the benefits of removing the structure from the floodplain relative to the costs incurred to do so.

Benefit Calculation

Per the guidance, the flood damage reduction benefits for the floodplain evacuation analysis will be calculated as the flood damages reduced. The economic model was developed to calculate with uncertainty the damages the structure incurs due to its location within the floodplain. The depreciated replacement value was developed for the structure and its contents using the methodology annotated in this appendix. Content value information was provided directly from closed NFIP claims courtesy of Mack Electric Devices. Figure 1 shows the damage – frequency function, plotted on a logarithmic scale, derived for 1 North Ave. The damages are calculated as the mathematical integral of the damage – frequency relationship. Because the analysis is to remove the structure, this damage measurement would also be the benefit of removing the structure. The benefits totaled to approximately \$85,000.

Figure 2: Damage - Frequency Curve for 1 North Ave.

Real Estate Costs

The Real Estate appraisal section of the USACE Baltimore District (NAB) developed the real estate costs comparable for the analysis. In order to avoid double counting of any internalized portion of flood damages reduced adjustments were made to the real-estate costs as outlined in CECW-PD 22 January 2001. The economic analysis uses the flood-free land costs in the valuation of floodplain land. Flood-free land cost is the cost of comparable flood-free land and associated structures but without the flood-risk (defined as outside the FIA-designated 100-year floodplain.) The results of NAB's appraisal are displayed in Table 1, below.

Table 20: Summary of Flood-Free Land Cost

	Low Range	High Range
Sales Comparison	\$180,000	\$220,000
Income Approach	\$192,900	\$289,000
Point Estimate of Flood-free Land Cost	\$230,000	
Contingency of 10%	\$23,000	
Total	\$253,000	

The total flood-free land cost is approximately \$253,000.

Conclusion

The floodplain evacuation analysis for 1 North Avenue yields a benefit-to-cost ratio of 0.34. The net benefits are calculated as the difference between the benefits and the flood-free land cost. Table 2 displays the pertinent data under scrutiny. Because the benefits do not exceed the costs, it is not recommended to consider the property for flood-plain evacuation.

Table 21: Floodplain Evacuation Summary of Benefits and Costs

Benefits	\$85,000
Flood-Free Land Cost	\$253,000
Net Benefits	-\$168,000
BCR	0.34

6.4 Economic & Engineering Performance of Alternative Plans

As shown on Table 17, benefit-to-cost ratios (BCRs) for the alternatives range from 0.28 (D28) to 3.02 (D27). Net benefits are calculated as Average Annual Benefits minus Average Annual Costs, and range from -\$112,000 (D28) to \$725,000 (D27). Figure 2 shows a graphic comparison of the economic performance across each of the nine alternatives. Any negative net benefits estimated by any of the alternative projects performance were excluded from the figure below.

Section 10 of this appendix contains all the tabular data and graphical displays for the Tentatively Selected Plan (TSP), alternative plan D27.

Tables 18 and 19 describe the EAD, EAD reduced, and costs, respectively. Tables 20 through 29 describe the engineering performance of the without project conditions and each alternative plan. Each economic reach per plan is displayed to show detailed information.

7. TOOKANY CREEK STUDY REACH DELINEATION MAPS

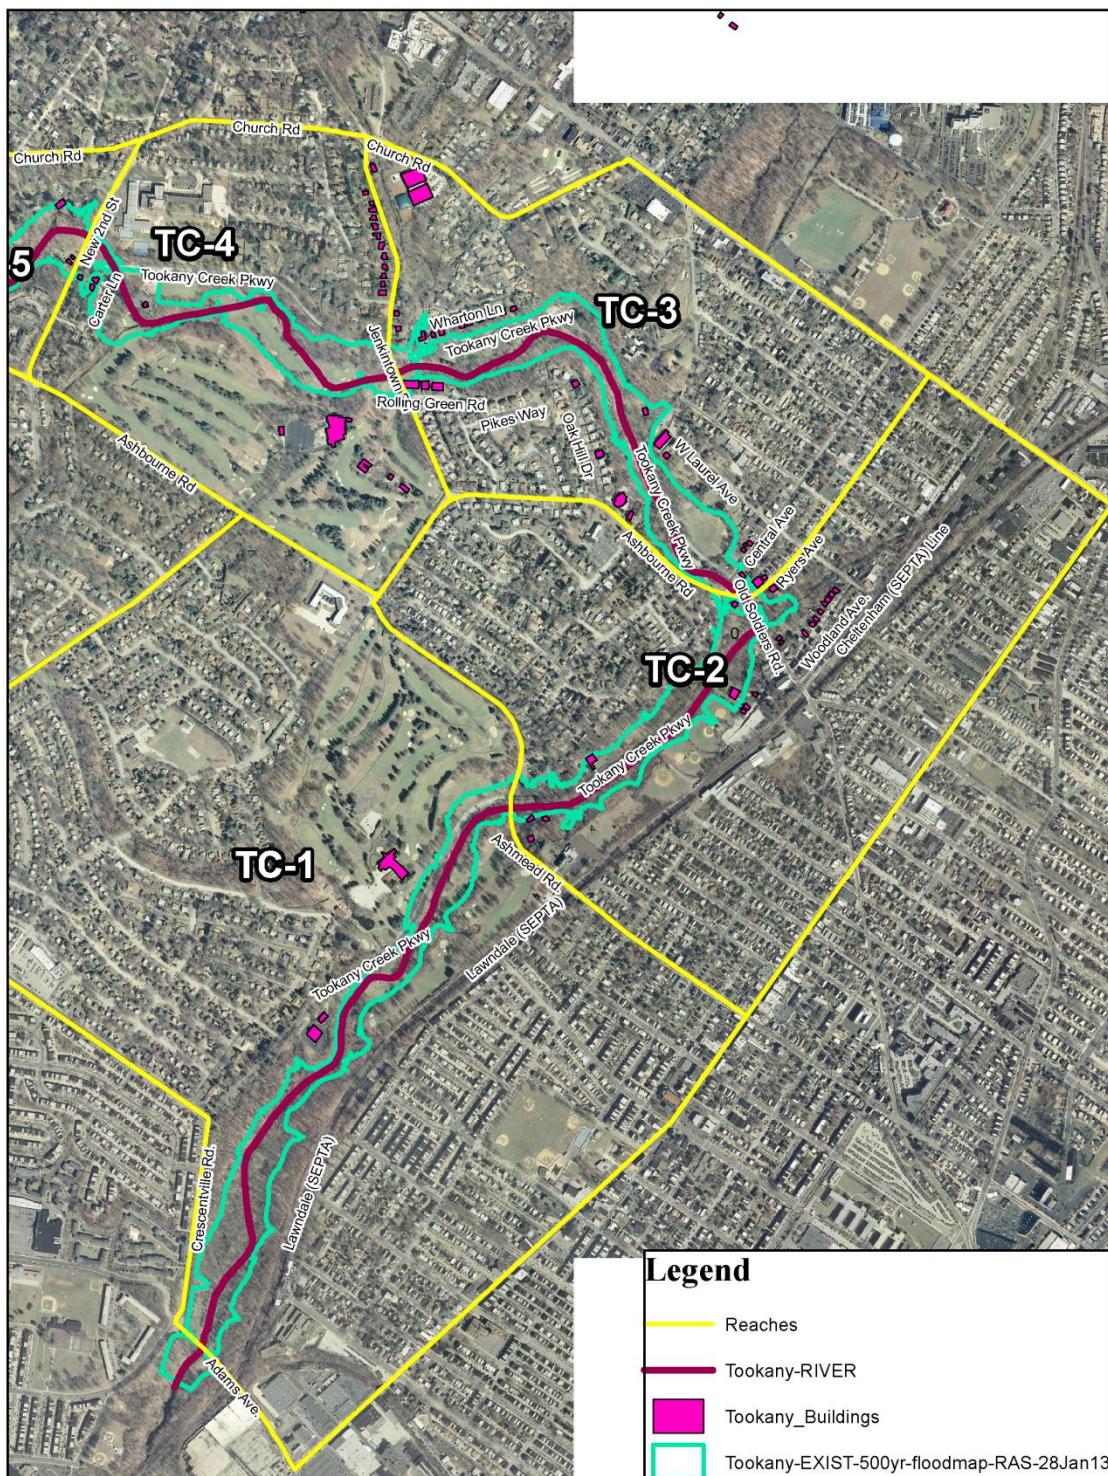

7.1 Tookany Creek Study Area

Tookany Creek Flood Risk Reduction Study Reaches

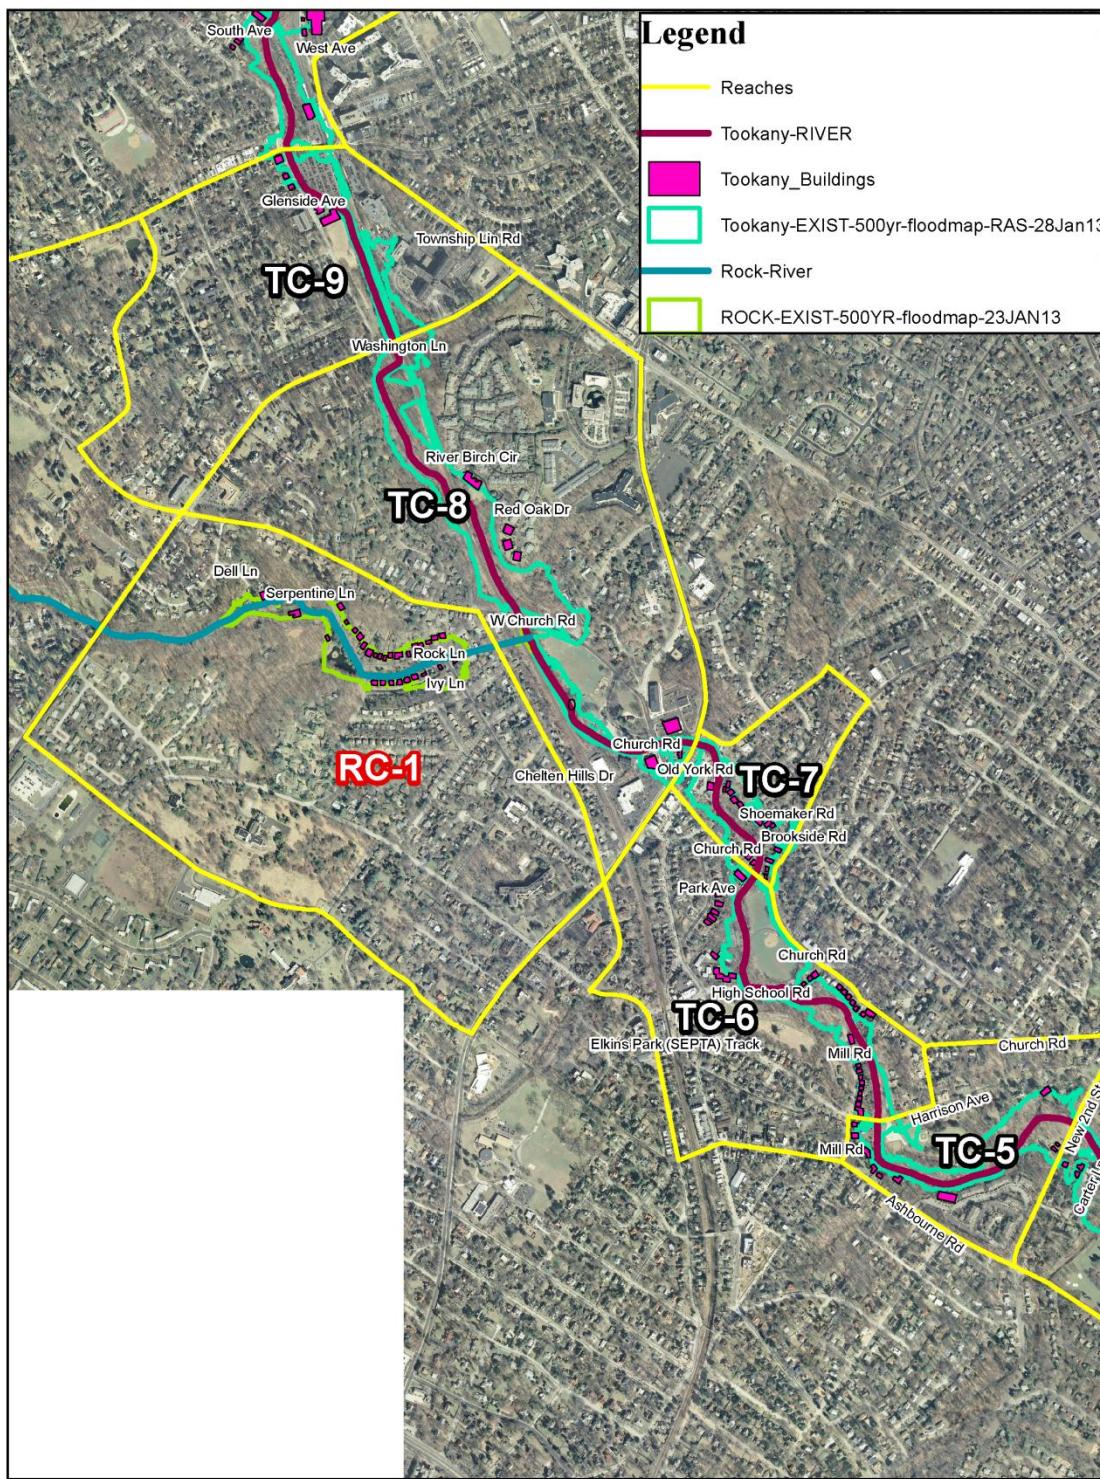

7.2 Reaches 1–4

Tookany Creek Flood Risk Reduction Study Reaches TC-1 Through TC-4

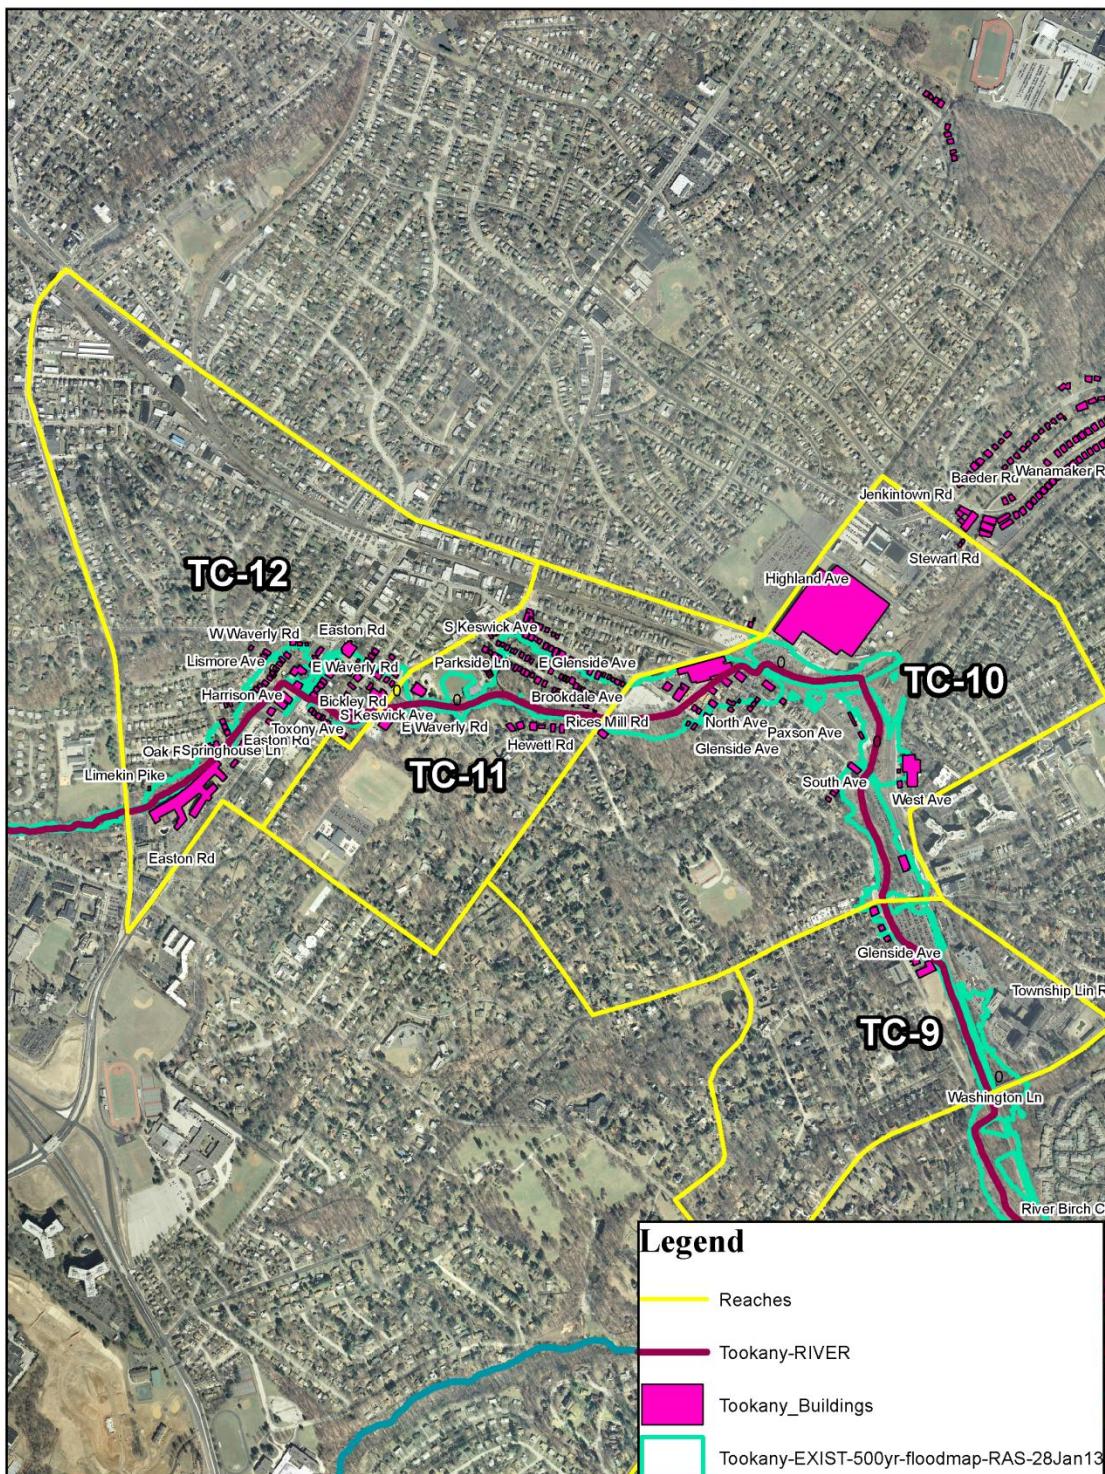

7.3 Reaches 5–9

Tookany Creek Flood Risk Reduction Study Reaches TC-5 Through TC-9, & RC-1

7.4 Reaches 9–1

Tookany Creek Flood Risk Reduction Study Reaches TC-9 Through TC-12

8. TOOKANY CREEK HEC-FDA STUDY STRUCTURE OCCUPANCY TYPE DEPTH-PERCENT DAMAGE FUNCTIONS

Tookany Creek Study
Exceedance Probability - Damage Functions
for Damage Reach RC-1
(Damage in \$1,000's)
Version 1.4, Sep. 2014; Less Simple Method (0.010)
Date Calculated Wed Oct 21, 2015 10:10:59 AM Eastern Daylight Time

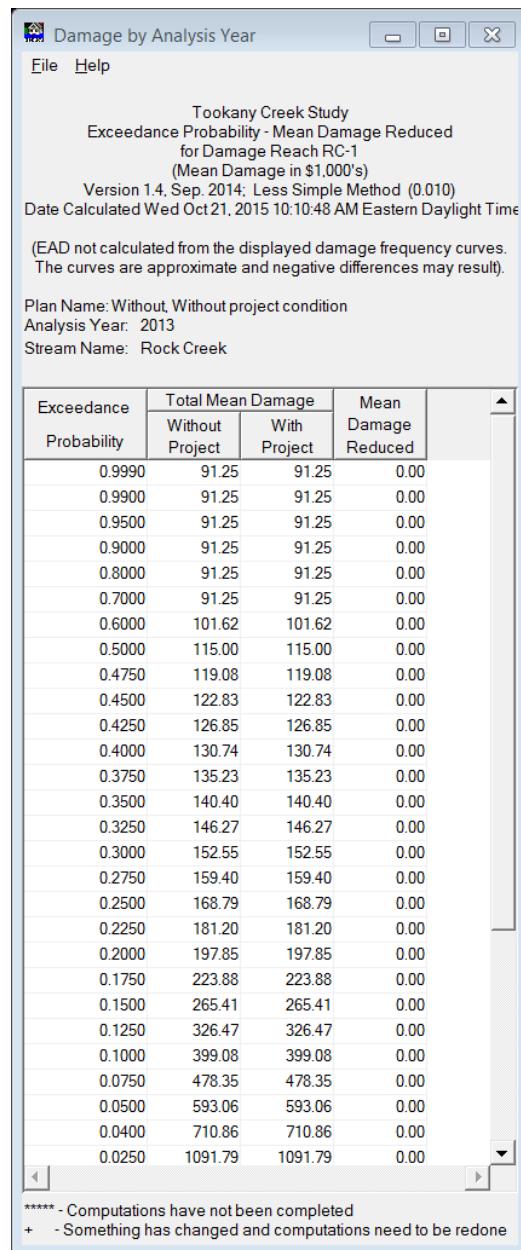

Plan Name: Without, Without project condition
Analysis Year: 2063
Stream Name: Rock Creek

Damage by Damage Categories

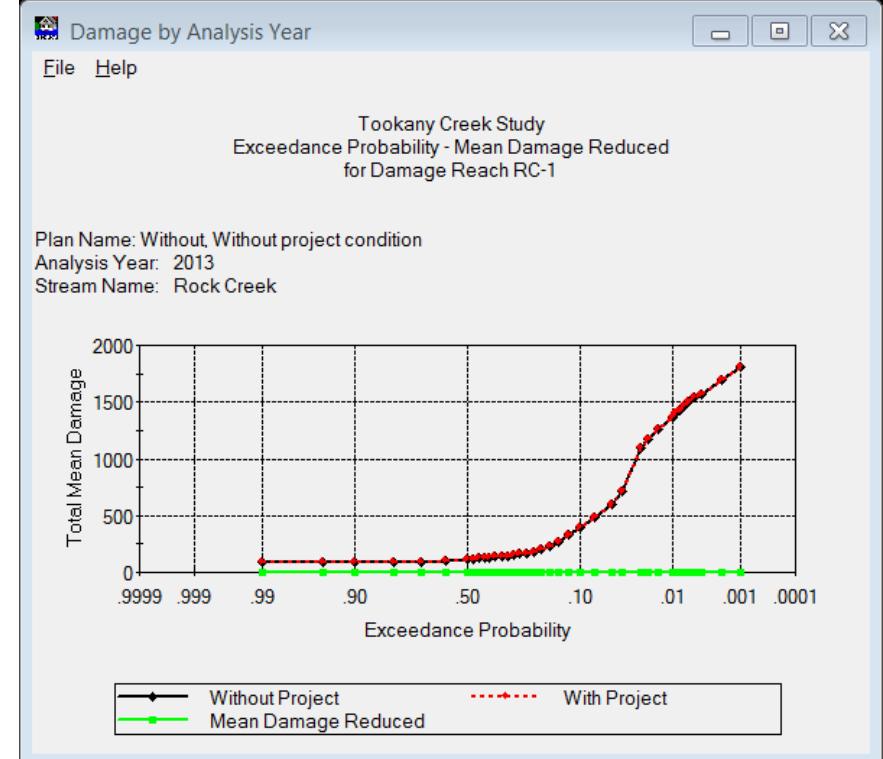

Exceedance Probability	Commercial	Industrial	Public	Residential	Total Damage
0.9900	0.00	0.00	0.00	88.97	88.97

Tookany Creek Study - Stage-Damage Function at Index Location

File Edit View Help

Plan: D27 Stream: Tookany Creek

Analysis Year: 2063 Damage Reach: TC-12

Damage Category: Residential

Function: AggDamg004281 Use An Existing Function

Description:

Define Uncertainty
 None Normal Triangular Log Normal

	Stage (ft)	Damage (\$1,000's)	Standard Deviation of Error
1	242.20	0.00	0.00
2	242.40	0.00	0.00
3	242.60	0.00	0.00
4	242.80	0.00	0.00
