Notice of Five-Year Review Completion: Chemours Chambers Works FUSRAP Site, Deepwater, NJ

PHILADELPHIA – The U.S. Army Corps of Engineers (USACE), Philadelphia District, has completed a five-year review of the Chemours Chambers Works FUSRAP Site in Deepwater, New Jersey. In the 1940s, manufacturing operations for the federal government resulted in radiological contamination in limited areas of soil and groundwater. USACE is addressing site cleanup under the Formerly Utilized Sites Remedial Action Program (FUSRAP). The remedial action as defined in the Record of Decision (ROD) includes soil excavation and monitored natural attenuation for groundwater to address radioactive contamination.

The purpose of a five-year review is to determine if the remedy is and will continue to protect human health and the environment. The results of the five-year review indicate that the site remedy will be protective of human health and the environment upon completion. In the interim, remedial activities completed to date have adequately addressed all exposure pathways that could result in unacceptable risks in these areas.

A copy of the five-year review can be found at Pennsville Public Library (190 South Broadway, Pennsville, NJ 08070) and at the USACE Philadelphia District's website (see below). The next five-year review for the site is required five years from the completion date of this review, or March 2028.
